

# Rocks in the Crust of the Earth

I had lots of fun with this song in my concerts this summer! You can print out the pages with the names of the rocks, and use them to explain the following:

- The crust of the earth is the top layer; the layer we see.
- It is made up of three kinds of rocks.
- As you hold up each picture, point to the word and say it  
(the pictures above each word will help children learn and remember what distinguishes each kind of rock)

\*If you need a refresher course on rocks, visit [www.Enchantedlearning.com](http://www.Enchantedlearning.com), or check out an easy non-fiction book about rocks from the library. One of my favorites is, *Is There a Dinosaur in your Backyard?*, by Spencer Christian.

You might want to mount the 3 rock pages on card stock, and let a child hold each one. Have each child raise and lower the correct rock as you sing about it. This is how I sang the song this summer, and children of all ages loved it- and knew about rocks by the end of the song!

## The lyrics:

### CHORUS

Igneous, metamorphic, sedimentary  
Igneous, metamorphic, sedimentary  
Igneous, metamorphic, sedimentary  
These are the rocks in the crust of the earth

Igneous rocks are from the lava that flows  
From the mighty volcanoes  
When that lava is good and cool  
Igneous rocks will form, that's the rule (chorus)

Metamorphic rocks are the king of change  
Over time they will rearrange  
Add a lot of pressure and get them hot  
What they are becomes what they're not (chorus)

Sedimentary rocks are like last night's dinner  
Leftovers made into something new  
Layer upon layer over lots of time  
Fabulous fossils are what you may find (chorus)

sedimentary

igneous

metamorphic
