

Spring Is Here (It's Biology)

You never know where the inspiration for a song will come from! I was watching one of my favorite weekend shows, CBS Sunday Morning, when a segment ended with a question: "Why do birds sing so early in the morning in the spring?" After the commercial the answer, "It's biology" flashed on the screen. I have always wondered why birds start singing at 4 AM - but have always known it was a sure sign of spring. It's mating season, and there's not a minute to waste! Males start singing to attract a mate, and their songs can be heard in the pre-dawn darkness. It's biology, and that's something to sing about!

Spring Is Here (It's Biology)

1. Spring is here and the days are getting longer
All the birdies start their singing long before the morning light
(repeat)
It's biology, it's biology
As the birdies start their singing long before the morning light
 2. Spring is here and the days are getting longer
As the sun warms the soil and the plants begin to grow
(repeat)
It's biology, it's biology
As the sun warms the soil and the plants begin to grow
 3. Spring is here and the days are getting longer
Baby animals are born and they have food enough to eat
(repeat)
It's biology, it's biology
Baby animals are born when there is food for them to eat
- It's biology, it's biology
As the days are getting longer all is growing in the spring
